Subject:	Permission Update Script (INF-19404)

Pietto,

I'm really sorry it was taken so long to get back to validating this. There are a couple of issues with the script. One is that the script is using Get-ADUser to get the SID for the account in question. The problem with that is this machine is not domain joined and doesn't have RSAT tools installed on it. I am going to have as part of the steps to have the person doing the task to manually collect the SID from a domain controller.

Can you just have the script prompt for the SID?

Another thing is we don't want to change the owner. It is owned by SYSTEM and that's fine. It can stay that way.

And the last thing is when I ran the script it didn't set any permissions. It just wiped them out completely. See below:
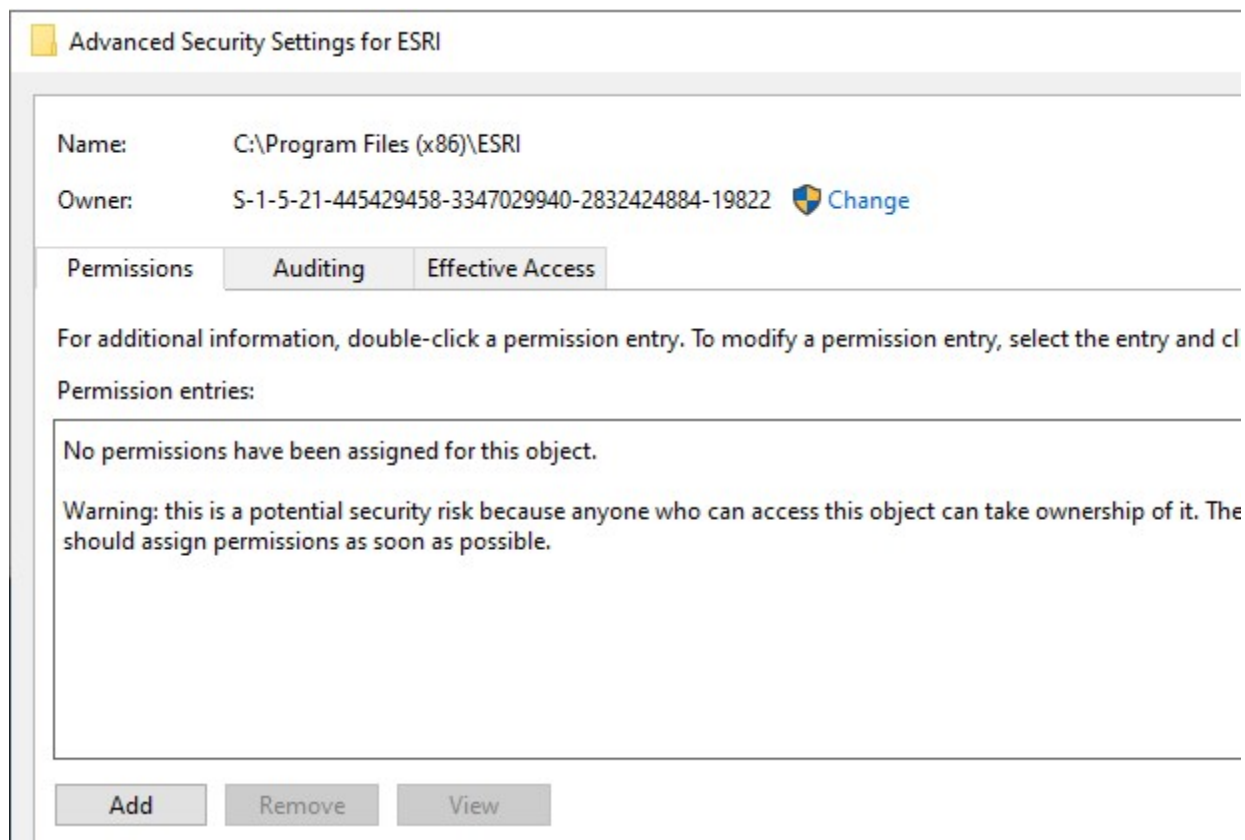

Thanks,

Jarrod Ellsworth
